Earth & Ocean Systems Releases Bio-Friendly Plant Technologies for Professional and Home Gardeners

Pasco, WA – Earth & Ocean Systems, a Pasco, Washington-based plant technology company, today released the first nine of its plant nutrient products for professional and home gardening use. This is the first time these products have been available outside the agricultural market.

Earth & Ocean Systems bio-friendly technologies help plants absorb nutrients faster and more efficiently through the soil and leaves than traditional fertilizers. They provide specific macro- and micronutrients plants need to grow stronger, larger, and more colorful. Oxy Burst, for example, is a stable form of liquid oxygen that results in more robust and dynamic growth. Nutrients included in GHP, promote vigorous blooming and growth, while increasing blossom size; and Nu-Roots fortifies a plant's root structure, providing better nourishment. Additional Earth & Ocean Systems plant technologies being released to professional and home gardeners include Aqua Drops, Complexer, N-R-G, Ful-Bloom, Bio-Bloom, and pH Drop. See www.eosnutrients.com for more information on these plant technology solutions.

“All the products we develop and manufacture use mineral and botanical ingredients mined from the earth and ocean,” said Miranda Yawney, Chief Operating Officer. “Instead of threatening the environment, our products improve and rejuvenate plants and the soil by recycling some of the nutrients nature has given us.” Yawney will be at the Indoor Gardening Expo in Vancouver on May 7 and 8 to showcase the products.

Earth & Ocean Systems is a research-driven company formed in 1998 as a spin-off of Northwest Agricultural Products (NAP). In the last 16 years, NAP has formulated more than 300 products to improve plant health, crop-cycle time, and quality and yield of crops.
